

Aggregation switch connects multiple networks

Focus creates quality products

Overview

An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. An Aggregation or "Top-of-Rack" switch is designed to connect everything in a rack at high speeds, then have an even bigger pipe out to the rest of the network. The Pro Aggregation does this with it's SFP28 25Gbps ports. The regular Aggregation switch is best used to connect all devices in a rack. Switch aggregation, also known as link aggregation or trunking, is a method used in computer networking to combine (aggregate) multiple network connections in parallel. It is essential for larger networks requiring efficient data flow.

What is Switch Aggregation, Its Role and Selection Advice

Switch aggregation refers to the concept of consolidating multiple access layer switches into a single aggregation layer switch in a traditional three-tier network design.

What is an Aggregation Switch?

Usually, when the aggregation switch receives data from the access switch, it will perform local routing, filtering, traffic balancing, and QoS priority
