

Can loops occur in core switches

Overview

If switches work in the core layer, it could bring the entire network down. Switching loops occur when network switches are connected together in such a way that network traffic loops around infinitely instead of traversing the hops needed to travel from source to destination. you can enable route guard to minimize the issue : <https://www.com/c/en/us/support/docs/lan-switching/spanning-tree-protocol/10588-74.html> 09-09-2021 04:33 PM Generally. A network loop occurs when redundant connections between switches cause data packets to endlessly circulate, suitable to broadcast storms, high CPU usage, and network congestion. When a switch port is accidentally looped back via a cable or connected improperly, the loop can flood the network with broadcast traffic, degrade performance, and even cause a complete outage. To avoid this situation, you can use backup links. A switching Loop creates many performance-related issues. While redundancy is good for network reliability, it can cause serious problems if not managed correctly.

Yes, vlans can split up broadcast domains, but a storm will still cause issues on any switch that vlan extends through, including your core. Switches usually have some kind of additional

How to solve the problem of network loops caused by incorrect switch ...

Network loops can occur when multiple network switches are incorrectly configured, creating redundant paths between switches that allow Ethernet frames to loop endlessly. This can lead to network

Switch LOOPING

A bridging loop or spanning-tree loop caused a network outage. Switch loops due to different ports connected to each other in access level - which causes loops and traffic interruption.
