

Eliminate the glowing module

Overview

Installing a bypass capacitor with LED lights is an effective way of preventing them from glowing when switched off. A bypass capacitor helps reduce the voltage stored in the LED light and can be connected directly to it, allowing any surplus current to go unimpeded back into the. The transition from older lighting to modern Light Emitting Diodes (LEDs) brings significant energy savings, but it also introduces a unique electrical quirk known as “ghosting” or “afterglow.” This phenomenon involves the faint, residual illumination or occasional flicker that persists in a. I have an SH+ module from LCNa in the switchgear, both of its outputs are lighting circuits. Up to the point where I was using classic incandescent bulbs everything was ok. Now, however, after replacing them all, with LEDs, problems have arisen. This is caused by a small amount of current running through them, which can be annoying if you're trying to get some sleep in a dark room. This is commonly referred to as “LED Ghosting”. Our post will help solve the problem of. Have you ever turned off your LED lights, only to find them still glowing faintly in the dark?

This common scenario leaves many homeowners puzzled, wondering why LED lights glow when off. Addressing this issue is crucial, as it can impact both your energy consumption and the ambiance of your home.
