

Final stage protection of the distribution box

Overview

Final distribution systems come with multiple layers of protection: Overload and Short Circuit Protection: MCBs prevent wiring from overheating. It's what ensures the lights turn on, your laptop charges safely, and machinery runs without risk. Circuit breakers and RCDs alone don't provide complete protection—they handle. In the final power distribution, we provide a variety of building household power distribution boxes to meet the needs, including NGK5, NX30, DB2, DB4, NX3, etc. These final power distribution boxes have a variety of advantages: NGK5 supports single and double door options, protection level up to. TECO GROUP manufactures final distribution boards (FDB) that form the last stage of the power distribution hierarchy — delivering protected electrical circuits directly to lighting, power sockets, small equipment, and individual end-user loads. High voltages and currents, if not properly managed, can lead to system faults, equipment damage, fire hazards, and even fatal accidents. The human body, for instance, can generally tolerate currents below 50 milliamperes. In lightning protection, the surge protection device in distribution boxes plays a crucial role.
