

Firewall optical module interface

Overview

SFP (Small Form-factor Pluggable) is a compact, hot-pluggable network interface module used to connect network devices (switches, routers, firewalls) to fiber optic or copper cables. Optical modules work in the host usually need to read the internal information of the module to understand its working status, such as module connectivity and real-time collection of light, temperature, etc. 3 committee and the Small Form Factor Committee (SFF). Each interface definition is supported by. Simplify optical connectivity with patch panel and cable assemblies for 4x10 to 400G breakout. Simplify the deployment of service assurance with granular, real-time performance visibility. Cost-efficiently deliver triple-play services to subscribers in fiber-to-the-premises applications. Think of it as the “translator” for your network equipment, converting electrical signals into optical signals. The following table provides a list of supported 3rd party SFP and SFP+ modules that can be used with SonicWall firewalls.
