

How much does an intelligent cold aisle immersion liquid cooling system cost

Overview

Capital costs range USD 1,800-3,200 per kW of cooling capacity including distribution infrastructure. Water-side economization (using cooling towers when ambient wet-bulb allows) reduces annual cooling energy by 40-65% in temperate climates versus mechanical chilling alone. Liquid immersion cooling achieves PUE of 1.10/kWh electricity — payback as low as 1.6 years at 80+ kW/rack. Water savings reach 95-98% vs evaporative. From OEMs and HVAC majors buying their way deeper into liquid-to-chip, to capital flowing into microfluidic cold plates and high-efficiency chillers, to immersion systems pushing out to the edge and even into battery storage, the thermal stack around AI is being rebuilt in real time. What's. Let's explore the fundamentals of immersion cooling and provide a cost-benefit analysis to help you decide if it's right for your data center. Immersion cooling is a technique in which electronic components, such as servers, are submerged in a thermally conductive liquid to dissipate heat. Unlike. The cost of direct-to-chip (D2C) liquid cooling systems for GPU servers, normalized per chip, ranges from US\$200 to US\$400.
