

How much light does a 10dB attenuator attenuate

Overview

A: 3 dB attenuation represents approximately a 50% reduction in power, while 10 dB represents a 90% reduction. Q3: Can I use different units besides Watts?

A: Yes, as long as both input and output use the same units (mW, kW, etc.), the dB result will be the same. This formula quantifies how much the signal weakens as it travels through a circuit. Now let's take an example to learn how we can use this formula: Imagine you have a circuit that takes an input of 20. For example, a 10 dB attenuator followed by a 6 dB attenuator provides 16dB of attenuation overall. $10 \text{ dB} + 6 \text{ dB} = 16 \text{ dB}$ Changing sound levels are perceptible roughly proportional to the logarithm of the power ratio (P_i / P_o). An amplifier has a power gain of 2 (if you put in one watt, you will get out two watts).
