

How to install a long strip to shield the distribution box

AI Overview

Install the shielding strip by preparing the cable, applying grounding braid, wrapping with mastic and tape, and shrinking the cold shrink tube to ensure a secure, watertight, and grounded shield. Preparation and Safety Power Off and PPE: Ensure the distribution box is completely de-energized. Wear insulating gloves, safety glasses, and slip-resistant shoes to prevent electric shock or injury. Inspect Materials: Check the shielding strip, cold shrink tube, mastic, vinyl tape, and grounding braid for damage or missing parts. Clean Work Area: Ensure the installation area is dry, free of dust, and accessible for proper handling. Step-by-Step Installation Prepare the Cable: Strip the insulation to expose approximately 1.25 inches (31.8 mm) of shield wires. Ensure the conductor length is appropriate for connection. Position Ground Braid: Place the preformed ground braid along the cable jacket, wrapping it around the exposed shield wires. Cut off any excess without overlapping the braid onto itself. Apply Mastic and Vinyl Tape: Wrap the end of the cable accessory with a layer of mastic followed by vinyl tape to provide insulation and moisture protection. Install Cold Shrink Tube: Slide the cold shrink tube over the mastic and tape layers. Pull the cord to shrink the tube fully over the installation area, ensuring at least 0.25 inch (6.4 mm) extends beyond the tape edge. Connect Drain Wire and Braid: Attach the drain wire to the cable accessory and connect the braid to the grounding point of the distribution box to ensure proper electrical shielding. Finalize Installation: Follow the cable accessory manufacturer's instructions for any remaining steps. Recycle the excess portion of the cold shrink core. Additional Tips Check IP/NEMA Ratings: Ensure the distribution box and shielding materials meet the required protection level for dust and water ingress, especially for outdoor installations (IP66 or higher recomme...
