

Installation price of power distribution cabinet in computer room

AI Overview

The installation cost of a power distribution cabinet in a server or computer room typically ranges from \$1,500 to \$10,000 or more, depending on the type, capacity, and complexity of the installation.

Factors Affecting Price

Type of PDU or Cabinet

Basic PDUs: Simple power strips without monitoring or remote control, suitable for small server rooms, generally cost \$200–\$800 for the unit itself, with installation adding \$300–\$1,000 depending on labor and wiring complexity.

Metered or Monitored PDUs: Provide real-time power usage data, load balancing, and energy management. Units typically cost \$500–\$2,000, with installation costs ranging from \$500–\$2,500 due to additional wiring, circuit protection, and integration with monitoring systems.

Intelligent or Smart PDUs: Offer outlet-level control, remote monitoring, environmental sensors, and integration with DCIM software. These units can cost \$1,000–\$5,000 or more, with installation potentially adding \$1,000–\$5,000, especially if dual feeds, redundancy, or high-density racks are involved.

Power Capacity and Phasing

Single-phase PDUs are generally less expensive than three-phase units. Three-phase cabinets, often used in high-density or enterprise data centers, require more complex wiring, circuit breakers, and safety compliance, increasing both unit and installation costs.

Installation Complexity

Costs increase with the need for hardwiring, dual A/B feeds, UPS integration, or custom rack mounting. Labor rates vary by region, but professional installation in a data center environment typically ranges from \$100–\$200 per hour, with total labor hours depending on the number of cabinets and complexity.

Additional Features

Environmental monitoring, surge protection, color-coded sockets, and modular connectors can add \$200–\$1,000 per cabinet.
