

## Is the OLT a core switch

### Overview

The short answer: an OLT is neither a traditional switch nor a router, but it incorporates functionalities of both, along with some unique roles specific to fiber access networks. An Optical Line Terminal (OLT) is a crucial piece of equipment in Fiber to the Home (FTTH) networks, commonly found in Passive Optical Networks (PONs). It acts as the central point of control and connection between the fiber-optic network and the broader telecommunications infrastructure. Let's discuss each one separately: 1. Below is a detailed breakdown: OLT is the core device in PON (Passive Optical Network) systems, connecting. The OLT is responsible for sending downstream data to multiple Optical Network Units (ONUs) or Optical Network Terminals (ONTs) at the user's premises, as well as receiving upstream data from them. Unlike traditional networking devices that operate purely on electrical signals, the OLT deals with.
