

Optical Network Unit and Optical Module

Overview

Key components of an OLT include a rack, a Control and Switch Module (CSM), an EPON Link Module (ELM or PON Card), and power modules. The ONU transforms the optical signal transmitted through the fiber into electrical signals, which then distribute to each subscriber. In this "last mile" of the information superhighway, the Optical Network Unit (ONU) plays a crucial role. As an essential node in Passive Optical Networks (PON), the ONU not only handles the conversion between optical and electrical signals but also supports various services such as data, IPTV, and orchestration of OLT (Optical Line Terminal) and ONU (Optical Network Unit) optical modules in networking is fundamental to the efficient and reliable operation of fiber-optic communication systems. A PON (passive optical network) refers to a fiber-optic network utilizing a point-to-multipoint topology and fiber optical splitters to deliver data from a single transmission point to multiple user endpoints. In contrast to AON, multiple customers are connected to a single transceiver by means of. The Optical Line Terminal (OLT) is the central component of the PON system, typically housed at the service provider's central office.
