

Should we use pigtails or fiber optic cables for extension

Overview

Are you building a permanent link?

→ Use a pigtail. Get it right, and the rest gets easier. There are four common connector types. If your panel has SC adapters. When you build or upgrade a fiber network, the same four words pop up everywhere— fiber optic (bare fiber), pigtail, patch cord, optical cable. Fiber pigtails are simple in appearance, yet essential in function. While both are essential for linking fibers to devices or other cables, they serve distinct purposes and are designed for specific scenarios. A fiber optic pigtail does consist of a connector on one side and a bare fiber on the other side, which in fact is a specific type of an optical fiber connector that researchers and engineers use in fiber communication systems. It enables the interconnection of optical cables by either mechanical. The choice between pigtail and patch cable significantly influences quality and maintenance in modern fibre optic networks: pigtails with single-ended connector termination suit permanent splice connections, while dual-ended patch cables enable flexible plug-in connections.
