

Single-mode single-core outdoor optical cable

Overview

OS1 single mode fiber optic cables are made with a single mode fiber core, which means that they have a very small core diameter of 9 microns. This allows the cables to transmit data over much longer distances than multimode fibers, with less signal loss and better quality. Modes are the possible solutions of the Helmholtz equation for waves, which is obtained by combining. Fiber optic cables for outdoor applications are engineered to withstand the more demanding conditions seen outside, from environmental extremes to mechanical forces. This small diameter core, typically around 9 microns in diameter, allows only one mode of light to pass through, resulting in a narrower beam of light. This is a black 500 foot spool of indoor/outdoor rated fiber optic distribution cable intended for long distance runs at high speeds. Its dry absorbent polymers eliminate water migration in cable interstices.
