

Variable Frequency Reactor Distribution Box

Overview

The Distribution Box for VFD ensures safe and efficient power delivery to Variable Frequency Drives. It's engineered to handle high-performance industrial applications with precision and durability. Moreover, it minimizes the risk of voltage spikes and improves system safety. On VFD outputs, reactors or filters are recommended. In practical terms, a three-phase line reactor is a set of three inductor coils (one per phase). Line reactors are sometimes used with variable frequency drive controls because they smooth out electrical power supply variations. However, not mitigating electrical disturbances and harmonics correctly may result in diminishing performance, damage to equipment, or even the presence. For more than 50 years, GE Vernova has supplied a broad range of reactors to markets around the world.
